

Small architecture

I trained first splitting one video frames into train, validation and test. Then, I also tried to train, validate and test with all the videos from just one signer. I rotated all the skeletons for plotting, so that the z-axis (predicted coordinates) are in the horizontal direction.

All keypoints

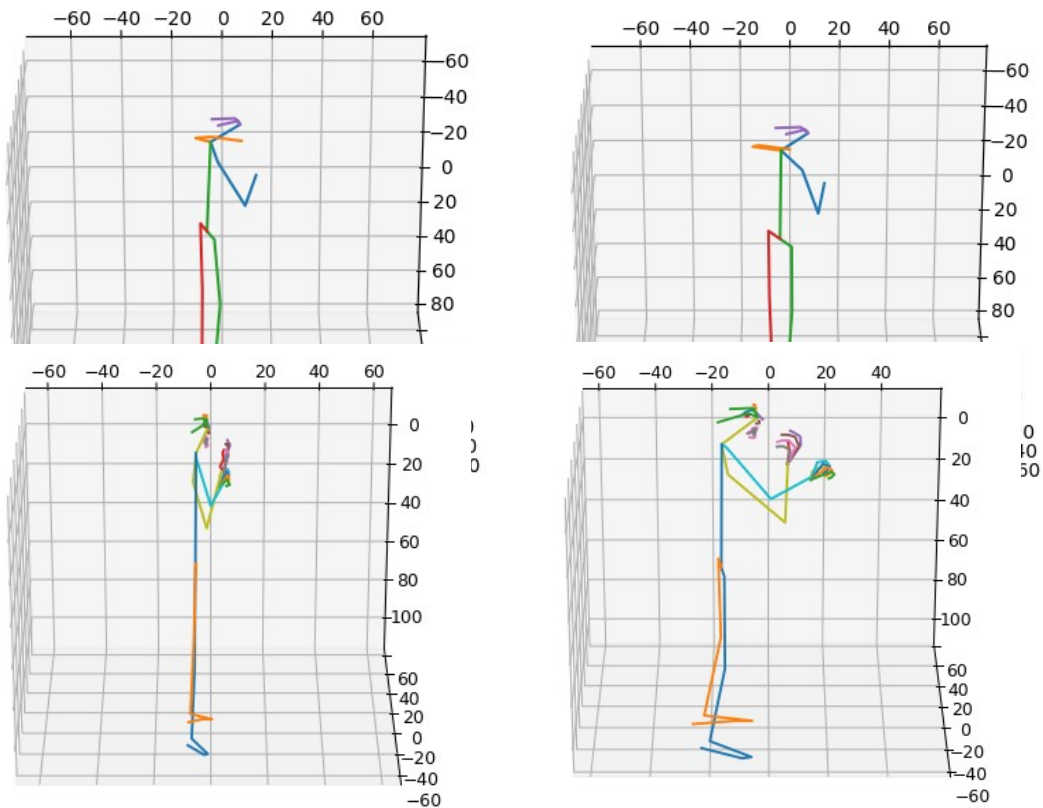

Using one video, results on testing data [predicted | groundtruth]:

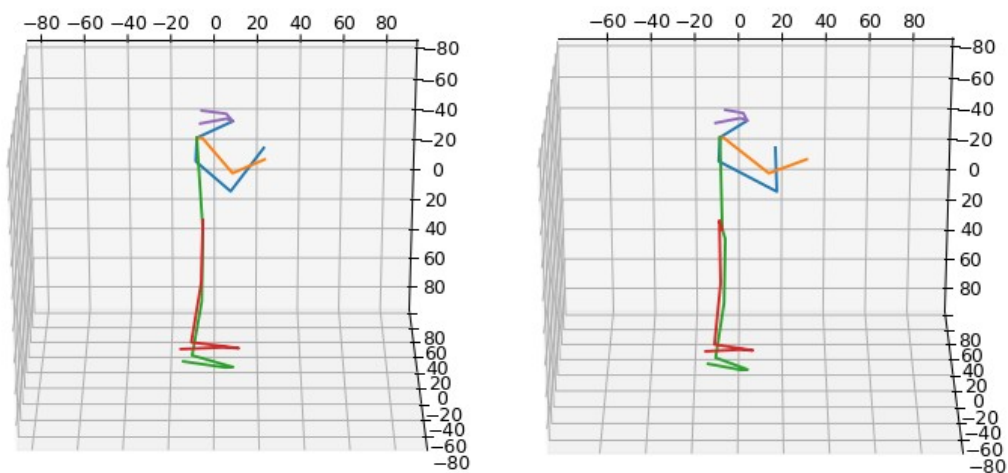

Using all the videos from a signer, results on testing data[predicted | ground-truth]:

Body

Using one video, results on test data [predicted | groundtruth]:

Using all the videos from a signer, results on testing data[predicted | ground-truth]:

Face

Using one video, results on test data [predicted | groundtruth]:

Using all the videos from a signer, results on test data[predicted | ground-truth]:

Hands

Using one video, results on testing data [predicted | groundtruth]:

Using all the videos from a signer, results on training data[predicted | ground-truth]:
